

Application of optical fibres for blade load measurement and condition monitoring

H.B. (Ben) Hendriks
Albuquerque, February 2004

What is an optical fibre?

Reflected light with wavelength equal to distances between “scratches”

What is an optical fibre?

Contents of presentation

- Introduction to ECN
- Introduction to condition monitoring
- Possibilities of optical fibres
- Test set-up
- Experience with optical fibres
- FOBM system layout

Introduction to ECN

Priority Areas

- Solar (PV)
- **Wind Energy**
- Biomass
- Clean Fossil (Fuel Cells)
- Policy Studies
- Energy Efficiency in the Industry
- Renewable Energy in the Built Environment

Introduction to ECN

Wind Energy

“With 45 employees the unit holds a strategic position between universities and industry covering all relevant wind energy disciplines; from trouble shooting to long term R&D, from training courses and design support to wind farm development and risk management.”

Four groups

- Wind Farm Development
- Wind Turbine Technology
- Wind Farm Operation
- Experiments

Introduction to ECN

Need for condition monitoring in wind energy

- Preventing damage and directly related costs
- Preventing revenue losses in case of damage, most significant for offshore wind energy
- Limiting the number of attendances (time to repair or inspection)
- Optimum planning using predicted remaining lifetime (seasons offshore)

Need for condition monitoring

33%

+ revenue
losses

Break-down of Generating Costs Offshore Wind Energy

Results from the
DOWEC study

Condition monitoring for wind turbines

Condition monitoring is a proven method in other branches. The application in wind energy differs from the present application:

- Stochastic loading versus stationary operation
- Preventing damage versus enlarging preventive maintenance period
- Trade-off between higher investment and lower damage costs

Condition monitoring for wind turbines

Condition monitoring is applicable to many wind turbine components:

- Blades
- Drive train
- Main bearing
- Generator
- General behaviour (degradation of power curve)
- Other...

Possibilities for optical fibres

All possible failure modes of the blades have been investigated on possibilities for condition monitoring systems

Some can be detected by a strain measurement; on basis of a changed strain distribution or a change in natural frequency or cumulative load spectrum

Possibilities for optical fibres

Trailing edge transverse crack

Trailing edge transverse cracks (details, source Allianz))

Possibilities for optical fibres

Supposed of a measuring strains with an optical fibre versus classical copper strain gauges:

- Non-conductive, important for lightning
- More simple instrumentation
- More reliable in time

Advantages to be demonstrated in 2 year R&D project

Possibilities for optical fibres

Topics of research:

- Accuracy of measurement (zero drift, temperature influence)
- Reliability in time (opto-electronics, sensors)

Next to field tests, laboratory experiments are planned in the WMC

Test set-up

The DOWEC demonstrator / NM92 wind turbine at the ECN test site

Foto Rob Nijda

Test set-up

108 m meteo mast

Distributed system:

- front-ends at different locations: sensor power supply and all signal conditioning, EMC proof
- glass fiber connections
- one central host pc: data collection and back-up, transfer to ECN database

st set-u

Fibre Optic Blade Monitoring (FOBM)

Applications for Wind Farm Operators

1. Converting raw data (*strain*) into meaningful parameters (*loads, vibrations*) for blade monitoring :
 - Assessment of loads (*extreme loads, fatigue load spectra, consumption of lifetime*)
 - Assessment of health and degradation
 - Design verification using design data
2. Informing operators about required O&M effort of blades

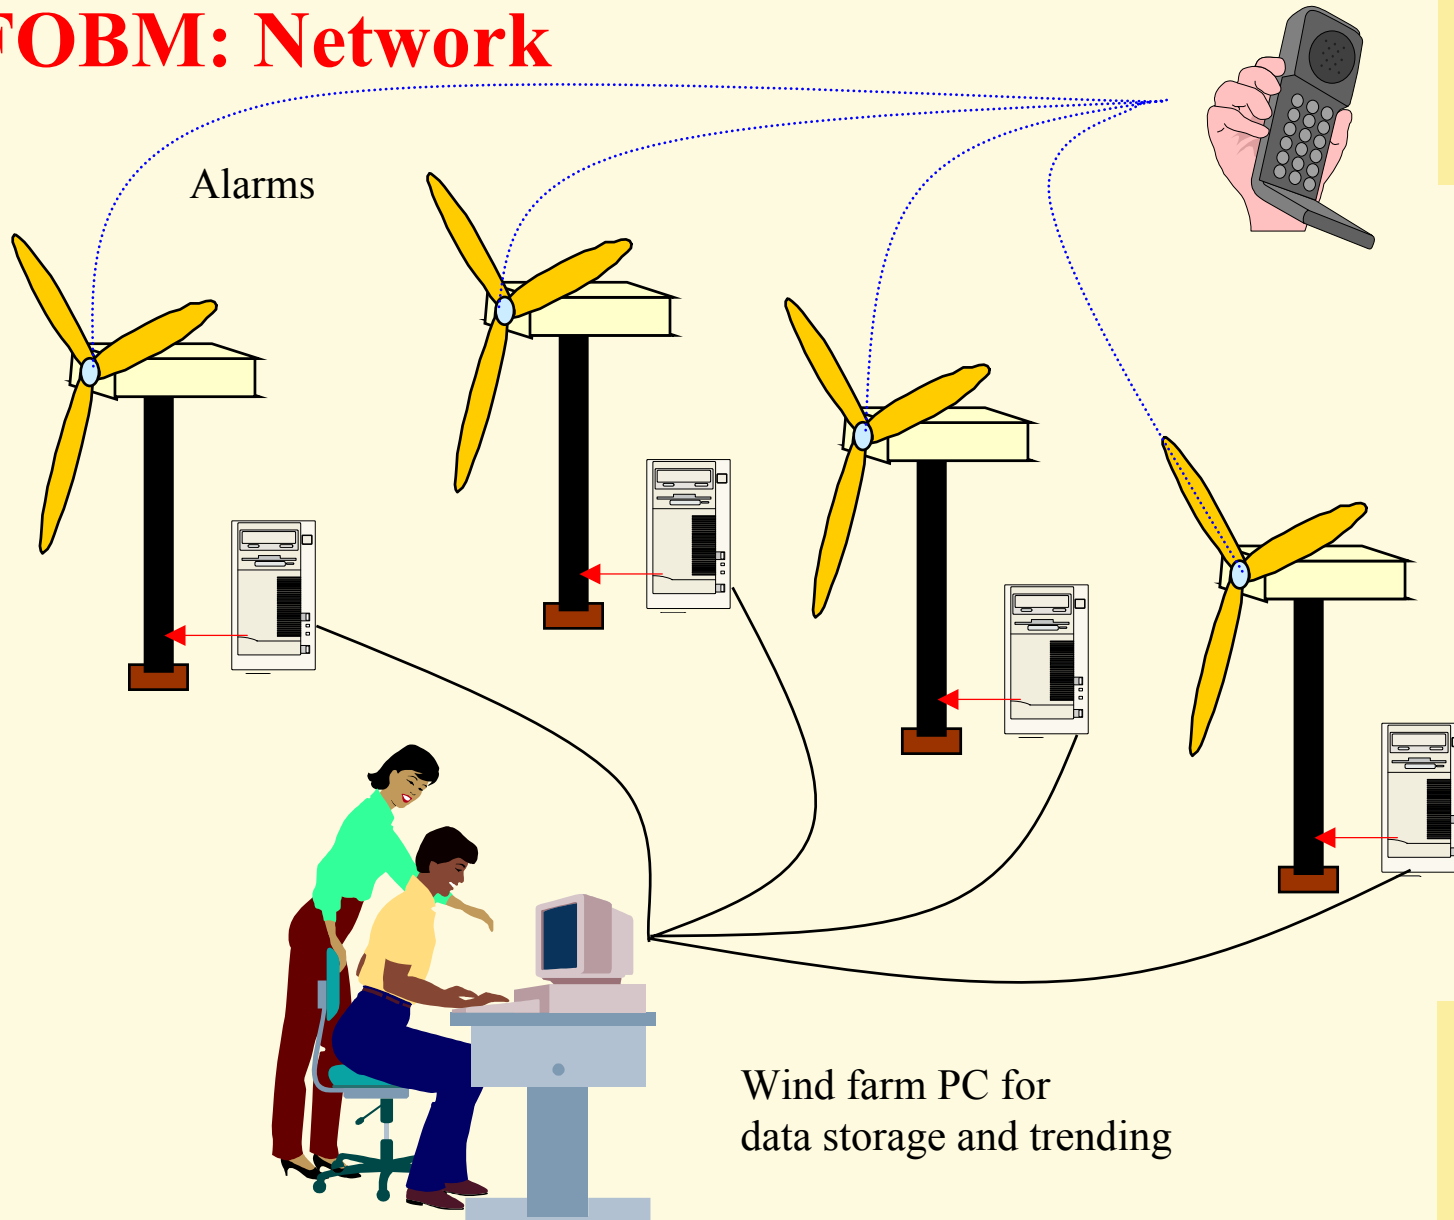

Example of time series
